

Udacity Camera Based 2D Feature Tracking

Abdelrahman Ahmad Saeed

Task MP.1

In this task, we have to set up a new optimized loading procedure that is capable of processing a large image sequence. This was achieved by a ring buffer data structure, in which there was a fixed data buffer size and when it's filled an image is popped out from the front.

Task MP.2

In this task, the existing implementation of key point detection included Shi-Tomasi algorithm only, and it was extended by implementing Harris detector in a separate function definition. And also, there was another function that included the modern key point detection algorithms like Brisk, FAST, ORB, AKAZE and SIFT detectors.

Task MP.3

In this task, the previous detectors functions were modified to calculate the times used by each detector to compare their performances. Also, all key points outside a predefined rectangle were removed to focus on the preceding vehicle which we want to track across the sequential frames.

Task MP.4

In this task, BRIEF, ORB, FREAK, AKAZE and SIFT descriptors were implemented in the key point descriptor function. Time calculation was added to compare the elapsed time for each descriptor.

Task MP.5

In this task, the existing implementation of matching key points function included brutal force matching, it was extended to include FLANN as well as k-nearest neighbor selector.

Task MP.6

In this task, the descriptor distance ratio test was implemented into the matching key points function, in addition to the cross check which was previously implemented. Both are used as filtering methods to remove bad key point matches.

Task MP.7

In this task, the number of key points on the preceding vehicle were counted for all 10 images. And this was done for all the previously implemented detectors.

Task MP.8

In this task, the matched key points were counted for all 10 images using all possible combinations of detectors and descriptors. In matching step, k-nn matcher was used with BF approach and descriptor distance ratio test.

It was noted from OpenCV documentation for AKAZE descriptor that it's used with AKAZE detector only. And from research in forums of OpenCV that ORB descriptor isn't used with SIFT detector.

Task MP.9

In this task, the time taken for all combinations of key points detectors and descriptors were recorded and compared to get the best 3 detector / descriptor combination. All the detailed results lies in the attached excel graphs.

The result we got that the top 3 combinations are:

1. FAST detector – ORB descriptor.
2. FAST detector – BREIF descriptor.
3. FAST detector – BRISK descriptor.
